

Secondary Process

Batley Foundry supply components used in various secondary process operations, including steel making, chemical processing, building material production and quarrying. With the world demand for steel increasing across all sectors, the requirements for quality castings on a tight turnaround has increased. We supply both hot-end and

cold-end components, austempered ductile rollers and coking plant castings, along with the more traditional general engineering items. We also supply castings in both rough and finished machined condition.

We produce a range of high chrome transfer worms and auger castings for mining and transporting of minerals or quarried raw material. Our diameters range from 300 to 1000mm and length from 300 up to 1500mm.
